****Scope of Work****
Client: Orin
****Project Address:**** 22100 SW Langer Farms Parkway, Sherwood, OR

Arrowhead Electric LLC provided labor and materials for the electrical rough-in and trim-out of the office and storage space areas.

****Office Space Rough-In****

Electrical rough-in was completed for the office space, including installing the required branch circuits to support the office layout and provide adequate power for general receptacle use, desk locations, TV locations, and space-heating loads.

Wiring was installed for the recessed can lighting and associated switch locations serving the office area. Switch boxes were installed at the required locations to provide proper control of the lighting layout.

TV receptacles were installed at designated wall locations. Receptacles were also installed at each office desk location to provide accessible power for workstations and office equipment.

Two-gang boxes were installed at selected office locations to allow for quad receptacle installations where additional plug capacity was needed. Additional receptacles were also installed outside of the office area as part of the overall electrical layout.

****Office and Storage Space Trim-Out****

Arrowhead Electric LLC also completed trim-out work for the office and storage space areas. This included installing electrical devices, receptacles, switches, cover plates, and required breakers in the panel.

All devices were installed, secured, and made up as required. Breakers were installed and circuits were terminated in the electrical panel. Work was completed in a clean and professional manner and checked for proper operation.

****Work Conditions and Difficulty****

This work required coordinating the electrical layout with the office build-out, desk locations, lighting placement, switching needs, and space-heating requirements. Additional care was taken to ensure the office area had adequate circuit capacity and convenient receptacle placement for everyday use.

The work involved both rough-in and trim-out phases, including routing wiring through the space, setting boxes, preparing lighting and switching locations, installing higher-capacity receptacle locations where needed, and completing final device and panel terminations.

All work was completed with attention to code compliance, functionality, and a clean finished appearance.
